/30a5/40a5 Now, I'm a little confused as to whether I should be using the ATX or mATX form factor for my next build. How to Add a Wide Sliding Range to a Tripod In a recent project, I needed to rig a jib for a friend who needed to make an oil painting.

A tripod wasn't a great fit for the job since it wasn't going to work for what I was doing. It turned out I had a few old tripods lying around that needed some love, so I thought I'd share a tutorial to demonstrate how easy it is to transform a tripod into a wide-angle stand. I've chosen to do it with a pair of Minolta Maxxum TLM 40mm and 30mm f/2.8 lenses. If you're interested in making something similar for your own applications, or just think this might be helpful, check out the tutorial below. Before Like many vintage Minolta systems, the Minolta Maxxum TLM series of lenses are screw-mounts, and have some good reason to be. The right mount has a built-in stop, preventing the bottom of the lens from falling into the camera when it's not mounted on the camera. You can see a couple of examples here, here, and here. But, you can also buy adapter rings that will allow you to use them on different mounts. For this tutorial, I'm using a Minolta TLM-H series ring that allows for mounting of the lenses on a lot of old Nikon SLR bodies. Modifying a tripod for a wide-angle lens is pretty simple, but not all that easy. First you have to mount a clamp onto your tripod head. Depending on the head you're using, this might be a permanent installation, or might need to be bolted onto a clamping point on the head. If you're using the end of a standard tripod leg as the clamping point, you'll need to drill or file the tripod head bolt out of the end of the leg, or use a chisel to create a partial thread in the head, which you can use to insert a bolt for extra security. Here, I'm using a Pro-Lite tripod head, and have drilled out the bolt in a couple of locations. I've attached a couple of rectangular washers with some 3/16-inch bolts, along with a nut, 82157476af
